AMENDMENT — AUDIT FINDINGS AND GEMINI-ORIGIN DRIFT TAG (APRIL DEPOSIT)

Version 2.0 amendment to “The Kolmogorov-Shannon Bridge: Field Materialization via 32-Byte Symbolic-Calculus Signatures” (deposited 2026-04-01, record 19380723). Amended October 26, 2026 by Gabriel (AI assistant) on behalf of the author, Leon Calvin Long II, under the SQUIRL OS audit-and-correction doctrine, per the author's directive of October 26, 2026. All original files are preserved unmodified in this record's version history.

1. Provenance tag

This paper is PROVENANCE-TAGGED AS A GEMINI-ORIGIN DRIFT SPECIMEN. It originated in the AI-assisted (Gemini-era) research line of early 2026 and carries the characteristic claims of that lineage: a source AI repeatedly asserted, and reinforced under challenge, that a 32-byte SHA-256 digest could contain or enable reconstruction of its committed corpus — a fabrication documented and acknowledged on the record (see DOI 10.5281/zenodo.23672787, Appendix A). The May 2026 sibling deposit (record 20113836) was audited and amended under the same doctrine on 2026-10-07; this April deposit was missed by that audit and is amended now.

2. Audit findings (same defect class as the audited siblings)

- **Defect 1 — The central materialization claim is false as stated.** “An informational cluster — independent of physical scale (KB to PB) — can be represented by a 32-byte signature” violates the pigeonhole principle: a 256-bit value addresses at most 2^256 distinct states and cannot specify arbitrary petabyte-scale data. A SHA-256 digest is a one-way commitment; it verifies a candidate supplied from elsewhere and cannot reconstruct its preimage.
- **Defect 2 — Transmission-limit bypass framing.** The “field materialization” / instantaneous-transfer framing implies a bypass of information-theoretic limits that the paper does not and cannot demonstrate.
- **Defect 3 — No proof or benchmark.** The paper presents its claims as established results without algorithm, proof, or fidelity test.

3. Corrected framing

The defensible concept is a seed-and-soil reconstruction framing: a compact 256-bit identifier selects and initiates reconstruction only where the receiving environment already holds the generative model or blueprint — content-addressed selection, not a bypass of information-theoretic limits. The corrected, audited treatment of this material is the Kolmogorov-Shannon Bridge primer v2.1 (Zenodo 10.5281/zenodo.22864620), which credits the classical lineage: Nyquist (1924), Hartley (1928), Shannon (1948), Kolmogorov (1965). The full correction of the digest-reconstruction narrative across SQUIRL OS materials is published as DOI 10.5281/zenodo.23672787.

4. Status

SUPERSEDED DRAFT — RESTRICTED — GEMINI-ORIGIN DRIFT SPECIMEN. Not citable as establishing any result. Retained for provenance under the append-only, version-preserving doctrine. Public audit ledger: github.com/LLong2026/squirrel-os-lindy-test.

SQUIRL OS RESEARCH DISCLOSURE — This work is part of an open-book, AI-assisted research program (author-directed, AI-executed) governed by an audit-and-correction doctrine: errors are corrected by disclosed, versioned amendments with originals preserved. This software and its documents are prototypes provided for educational and research purposes only; they are not intended for production use, commercial deployment, or safety-critical environments. All systems are experimental and may contain defects.
